Anchor Pull Testing

Excavation — In-situ rock tests Laboratory tests are usually performed in addition to and after field observations and tests. Sometimes the Engine Tests the Test Stand — The test of engine 2059 gave the SLS program valuable information about the engine, but it also provided unique information about the test stand. The range of the Uniaxial Compressive Strength for a large amount of typical rock types is presented in Table 2.

Geotechnical Testing Equipment for Soils, Rock, Geosynthetics

Figure 1: Stress-strain curve of the Unconfined Compression Test for a specimen of Basalt. The Systems Integration Test Facility-Qualification is shown left background. Likewise, the WCAs are cut into samples that are again put under the microscope at Marshall.

Rock Testing

Test articles for the core stage and upper stage elements of the vehicle will be placed in test stands beginning this year and subjected to loads that will mimic the launch experience.

Triaxial Testing Equipment For Soil

The Standard Anchor System has a pull stroke of 2 inches 50mm with an option to extend to 4 inches 100mm.

Triaxial Testing Equipment For Soil

When the resistivity of the concrete is high, it is assumed that the probability of active and rapidly advancing corrosion is low and vice versa. Then, a heavy load anywhere from 15 kgf to 150 kgf, depending on the material and its strength is applied and held for a period of time. The actual flight avionics will be installed directly into the core stage at the Michoud Assembly Facility in Louisiana and tested there prior to flight.

Rock mechanics testing equipment, Controls

Holding down the rocket motor is more than 13 million pounds of concrete — most of which is underground. Carbonation Test The natural

alkalinity in concrete provides a protective layer against corrosion. Friction from just moving through the air causes the nose of the vehicle to heat.
