River boats initially used a in which cold water from the river is injected into the exhaust steam from the engine. The design incorporated a number of important innovations that included using high-pressure steam which reduced the weight of the engine and increased its efficiency. Thereafter, technological developments and improvements in manufacturing techniques partly brought about by the adoption of the steam engine as a power source resulted in the design of more efficient engines that could be smaller, faster, or more powerful, depending on the intended application.
