Fatigue life prediction under variable loading based on a new damage model devoted for defective material

The multiscale approach is settled on the assumption that under high-cycle fatigue loading a structure will not be fractured by fatigue if an elastic shakedown state is reached at the macroscopic as well as at the mesoscopic scale.

In fact, since builders have drawn their attention to it, the phenomenon of fatigue in metallic assemblies has not lost any of its complexity, which is related in fact to the multiplicity of factors involved. Ben Ahmed A, Nasr A, Fathallah R Probabilistic high cycle fatigue behavior prediction of A356-T6 alloy considering the SDAS dispersion. The multiaxial stress amplitude is reported to the equivalent stress by combining it with the S—N curve and an algorithm to evaluate the damage model. The concept of the fatigue limit criterion coincides thus with the possibility of a cyclically loaded structure to tend to an elastic shakedown state at all scales.
