## Preoperative airway evaluation using multi

The interval of time between the onset of symptoms and presentation of the patient to the emergency department ranged between 1 and 8 days  
Mean±SD: 1.

## Preoperative airway evaluation using multi

Fusiform aneurysms involve the entire aortic circumference and may extend over a great length of the vessel.

## Preoperative airway evaluation using multi

This photo simulates the path that the x-ray beam makes as spiral CT data acquisition of the abdomen is being made.

## Spiral CT and Helical CT

One patient demonstrated extensive apical scarring accompanied by parenchymal distortion and paracatricial emphysema. The protocol for 3D MRA varies from institution to institution. During the procedure, the patient lies on a motorized table.

## Multislice Computed Tomography Coronary Angiography

The main challenge is the stability of both focal spot and detector position during rotation, in particular with regard to the high rotational speeds 0.

## Pediatric Multislice Computed Tomography of the Chest

In the mid 1980's, an innovation called the power slip ring was developed so that the elaborate x-ray cable and drum system could be abandoned.

## Feeding artery of a recurrent pheochromocytoma from the left internal thoracic artery demonstrated by multislice computed tomography

Today, invasive CA is still the cornerstone imaging modality for clinical decision-making in patients with suspected coronary artery disease CAD , and it also serves as an indispensable roadmap for percutaneous coronary intervention PCI.

### **x rays**

Preoperative chest x-ray and plain CT showed severe tracheal stenosis. Mycotic aneurysms result from infection of the aortic wall and occlusion of the vasa vasorum by septic emboli; this causes weakening of the wall resulting in aneurysm formation.
