### Management of Arrhythmias in the Perioperative Setting — Mayo Clinic

The immediate postoperative period is a dynamic time and is associated with many conditions conducive to the development of postoperative arrhythmias. Because  $Ca^{2+}$  currents do not initiate impulse propagation in the atria and ventricles, these agents only slow the ventricular response to atrial tachycardia, and usually do not acutely terminate arrhythmias arising in either the atrium or the ventricle. The exceptions are amiodarone and acebutolol Sectral.
