approach to the design and detailing of reinforced and prestressed concrete structures.

### Compatible stress field design of structural concrete

Since two-dimensional structural elements are statically redundant, it is possible for a particular loading to be in equilibrium with many theoretically an infinite number of stress states. Prior to joining ETH Zurich in 2014, he was active in the industry for more than 15 years, working mainly in Spain and Switzerland. In chapter 4 it is shown that this method is suitable for the design of reinforced concrete structures, and the consequence of the choice of the final structural system on the structural behavior is dealt with in detail.

Listen to the author speaking about the CSFM method ETH Zurich, Institute of Structural Engineering About Prof. His research focuses on innovative structures, the load-bearing and deformation capacity of concrete structures, the assessment of the structural safety of existing structures, and digital fabrication methods. If the lower bound method of the theory of plasticity is employed, then an admissible stress field or any combination of such stress fields may be selected.
