He, Peijun, Katis, Ioannis, Eason, Robert W. The resistivity behavior near the transition temperature has been found to be governed by the activated thermal dissociation of the vortex-antivortex pairs as revealed by the exponential dependence of resistance on VT. The rotor has been wound with Nb-Ti wire, producing peak magnetic field of 4 Tesla.

Little details gave each field a particular physiognomy, dear to the eyes that have looked on them from childhood: the pool in the corner where the grasses were dank and trees leaned whisperingly; the great oak shadowing a bare place in mid pasture; the high bank where the ash trees grew; the sudden slope of the old marl pit making a red background for the burdock; the huddled roofs and ricks of the homestead without a traceable way of approach; the gray gate and fences against the depths of the bordering wood; and the stray hovel, its old, old thatch full of mossy hills and valleys with wondrous modulations of light and shadow such as we travel far to see in later life, and see larger, but not more beautiful.
