

Development of event-based pathogen monitoring strategies for watersheds

Awwa Research Foundation - Managing Watersheds to Improve Land and Water

Project	Grantee (NGO/Civic Association)	Contribution to Landscape Resilience Outcomes	Description
"Jilun Adu" – The Great Andes River	Center for Development and Research on Social Movements Ecuador	Outcomes 1, 2, 3	Conserve tropical forest margins in the Great Andes River area, and create a community reserve. Design and manage municipal practices and legal regulations for local natural resource management. Promote local products made from non-timber forest resources to create local employment. Promote the empowerment of communities through partnerships for the conservation and sustainable use of natural resources, creating strategic alliances with universities, for example.
Conservation, management and sustainable production in the communities of Arajuno and Curaray	Dwellers Association Arajuno – AKA	Outcomes 1, 2, 3	Conserve and manage natural resources of the rainforest and watershed communities formed by the association of AMA and ALKACE, a purpose that goes hand in hand with the strengthening of the cultural identity of the Aikuna Nationality in Arajuno and Curaray. Restore the forest and watershed through reforestation. Increase the production of cocoa through an agroforestry system under the local cacao system or in combination with the cultivation of banana, plantain, corn, and other forest products used for making crafts.

Watershed Monitoring

In addition to these reports, presentations on the surveillance system findings are made to health care professionals in the New York City area. Although the sensitivity of these systems is potentially far greater than that of active surveillance, in some cases monitoring of medication sales and number of stool specimens examined, the data collected are surrogate measures for cases of gastroenteritis and do not have the specificity of laboratory-confirmed infections.

6 Tools for Monitoring and Evaluation

This is an appealing concept at a time when many people profess belief in an environmental ethic. In the face of increasing development in the watershed, the commission has been studying how much fresh water flow is required throughout the basin to protect critical habitats in the rivers and to supply the Chesapeake Bay. The handbook should be used to supplement the many good watershed planning guides developed by other agencies, universities, and nonprofit organizations.

6 Organizing for Watershed Management

This allows for close cooperation with local citizen groups, local governments and other state and federal agencies. If successfully designed, calibrated, and verified, water quality models can lead to reduced monitoring requirements over the long term. Further, 81% of these improvements can be attributed to or associated with agricultural conservation practices implemented by farmers and ranchers.

Monitoring for Pathogens

The USGS water resource program is financed by a combination of direct appropriations and reimbursable cooperative programs with other federal agencies and state and local governments USGS, 1994. Based on the committee's risk assessment using data from 1992 to 1998, the current daily risk of *Cryptosporidium* infection in New York City is 3. Performance monitoring also takes place at a high frequency in the Kensico watershed in comparison to the other New York City watersheds.
