Kidney Transplantation: Transplant Immunology and Use of Immunosuppression

T cells recognize MHC:peptide complexes through heterodimeric T-cell receptors TCRs expressed on their cell surface. In some transplants, for example young children and also bone marrow transplants, ABO compatibility is not a necessity.

Transplantation Immunology

The exact mechanism of chronic CNI toxicity is incompletely understood but may be related to chronic ischemic nephropathy. Chronic rejection Repeated episodes of acute rejection can ultimately lead to chronic rejection of the graft and failure of the transplant. Tacrolimus may be started at the time of transplantation or days after the procedure.

Multiple Choice Questions on Immunology

The cardinal features of the adaptive immune response are specificity to antigenic diversity, memory, and tolerance

Kidney Transplantation: Transplant Immunology and Use of Immunosuppression

Subsequently, immunosuppression can usually be significantly lowered for long-term patient management. ABO incompatible — ABO refers to blood group, which can vary between individuals.

Multiple Choice Questions on Immunology

The development of mouse models of orthotopic liver transplantation have provided an opportunity to gain mechanistic insight into the regulation of immune responses in the liver Qian et al, 1991.
