Diversity and overlap as measures of environmental quality

In this study, we examined sediment fluxes of N 2O during 2 years 2012—2013 in a shallow temperate estuary Waquoit Bay, MA, USA. The two plants have a very similar appearance, however *Vallisneria* has a light green stripe in the center of its leaves and its leaves are broader than those of *Zostera*. The objective of this study was thus to elucidate the effect of rhizosphere pH on NH₄⁺ tolerance in different winter wheat cultivars *Triticum aestivum* L.

Comparison of habitat use by estuarine fish assemblages in the Acadian and Virginian zoogeographic provinces

Annual Review of Ecology and Systematics 19:111—145.

Physiological responses of the opportunistic macroalgae *Cladophora vagabunda* (L.) van den Hoek and *Gracilaria tikvahiae* (McLachlan) to environmental disturbances associated with eutrophication

There were a total of 93 positions in the final dataset. From Costa 2003 State of Buzzards Bay presentation. Moderate levels of UV-A 315—400 nm can enhance photosynthesis of green, brown and red algae, while UV-B 280—315 nm mainly show inhibitory impacts.

Molecular evidence for sediment nitrogen fixation in a temperate New England estuary [PeerJ]

Thus, other heterotrophic sediment bacteria may be employing N₂-fixation for a similar reason.

Benthic community composition and faunal stable isotopic signatures differ across small spatial scales in a temperate estuary

We measured biomass and specific growth rate and analyzed water quality, sediment labile organic matter LOM, photosynthetic efficiency and pigments in two areas: one subjected to sediment resuspension and algal mass shuffling through specific boats and the other left undisturbed.

Distribution, production, and historical changes in abundance of eelgrass *Zostera marina* in southeastern Massachusetts.
