CRC Handbook of Laser Science and Technology (June 1982 edition)

The use of neodymium-doped materials is considered, followed by system sizing issues with diode-pumped quasi-three level materials, erbium glass lasers, and microchip, fiber, Raman and cryogenic lasers. The operating principles, the development, and the present state of two major classes of continuous flow combustion driven lasers--gas dynamic lasers GDL and chemical mixing laser CML, are reviewed.

Written by internationally renowned authors, this handbook serves as a cornerstone for laser applications and provides updated information for all physicians, particularly dermatologists, interested in implementing lasers in their practice. Each chapter has a good number of supporting figures as well as an extensive reference list at the end. Divided by type - solid, liquid, and gas - and listed in order of increasing wavelength, Handbook of Laser Wavelengths includes: crystalline paramagnetic ion lasers glass lasers color center lasers semiconductor lasers polymer lasers liquid and solid-state dye lasers rare earth liquid lasers neutral atom, ion, and molecular gas lasers extreme ultraviolet and soft X-ray lasers free electron lasers nuclear-pumped lasers lasers in nature lasers without inversion Brief descriptions of each type of laser are presented, followed by tables listing the laser wavelength, lasing element or medium, host, transition, and primary literature citations.

The Lasers in Dermatology Handbook is a tool to understand the use of lasers in clinical practice. Part one provides an introduction to the fundamentals of laser welding before moving on to explore developments in established technologies including CO2 laser welding, disk laser welding and laser micro welding technology.
