

Mixed dentition treatment with the Begg technique. (Slide/Tape)

American Assoc. of Orthodontists - Mixed Dentition

Description: Emphasizes the fact that early treatment thwarts tongue thrusting and other muscle habits. Stresses early orthodontic correction by the use of any banded orthodontic appliance rather than the use of cervical gear. Discusses cephalometric appraisal of 5 Begg technique treatment results.-

Refined begg technique

Figure 1: Initial photographs Figure 2: Treatment progress photographs There was no interproximal reduction prescribed, and there were no auxiliaries used. The same principle applies to a Class II division 2 malocclusion which shows multiple locks in the vertical and AP dimensions.

The limitations of orthodontic treatment: I. Mixed dentition diagnosis and treatment

But extraction in some cases can jeopardize stability and aesthetics when attritional occlusion is involved. Modified designs of arch wires are routinely used 5.

JCO Interviews the Kesling & Rocke Group on Begg Technique, Part 1

The patient was prescribed an upper Hawley retainer with the acrylic cut away from the posterior teeth to allow for unimpeded permanent tooth eruption for daily nighttime wear. To carefully monitor the sagittal and vertical anchorage 2. We, therefore, consider first the possibility of treating those patients solely from the orthodontic approach.

The limitations of orthodontic treatment; mixed dentition diagnosis and treatment.

Heavy forces can be detrimental, because they tend to loosen the anchor molars to the point that they are no longer a satisfactory source of anchorage.

The limitations of orthodontic treatment; mixed dentition diagnosis and treatment.

If it got to be a high percentage, we would probably have to reassess our approach. Â LATE ORGANIZATION Â Mechanics of early phase I continues but arch wire is placed in the edgewise slot of the anterior brackets. Helps to close the interarch space , level the mandibular arch and align teeth.

The Begg technique in Japan,1961

The resulting forces are physiologic and stop when the teeth have reached predetermined inclination. During closure of extraction spaces in stage II the most important thing is the 3- dimensional control of second premolars. Appointment intervals were every 6 weeks.
