Baby Experiments: The Visual Cliff

There is improved motor control, and the baby can release an object from his hand gently instead of dropping them. Many newborns get fussy or frustrated on their tummies, so keep these sessions brief at first — just a few minutes at a time.

Your Baby's Hearing & Communicative Development Checklist

While most term infants achieve physiological homeostasis without difficulty, careful assessment during this period of adaptation is required to ensure that the infant makes the transition smoothly and without compromise. Now that she's 2 months old, she's better equipped to soothe herself back to sleep, so let her fuss for a few minutes at night before you leap to her rescue. The baby will also extend his hands to reach objects at a distance, displaying greater muscle dexterity.

Understanding Newborn Characteristics and Development

Stability and outcome of persistent infant crying. Breast-fed infants will feed about every 2 hours.

Understanding Preterm Infant Behavior in the NICU

Part 1 of this paper examines the physiology of transition, focusing on the changes occurring in the cardiovascular and respiratory systems. Prenatal development is the process that occurs during the 40 weeks prior to the birth of a child, and is heavily influenced by genetics. This reflex doesn't start until about the 32nd week of pregnancy and is not fully developed until about 36 weeks.
