Regional Variation in Muscle Myogen Polymorphism in Walleye (*Stizostedion vitreum vitreum*) as Related to Morphology

Several alternative projects are suggested.

Abundance, growth, and life history characteristics of sympatric walleye (*Sander vitreus*) and sauger (*Sander canadensis*) in Lake Winnipeg, Manitoba

Joint data bases for species that straddle international boundaries have been developed to help manage the interceptions of salmon in one country migrating to another to spawn.

Book Regional variation in muscle myogen polymorphism in walleye (*Stizostedion vitreum vitreum*) as related to morphology by J. F. Uthe Download PDF EPUB FB2

Forms of threespine stickleback are found in anadromous and freshwater situations. This population provided the opportunity to test a population during or after selective pressure to adapt to a freshwater existence. Walleye of the south basin and channel region exhibit a bimodal growth pattern, previously unreported for walleye populations.

Regional variation in muscle myogen polymorphism in walleye (*Stizostedion vitreum vitreum*) as related to morphology (1970 edition)

A hemoglobin polymorphism has been found in south European stickleback, and a muscle myogen polymorphism enzyme: creatine kinase has been found in stickleback from western Canada.
