High dose desferrioxamine as a cause of growth failure in thalassaemic patients. The DFO-metabolizing enzyme in plasma exerts its maximum activity at pH 7. Treatment recommendations are based on results of deferoxamine diagnostic testing see table 1.

Desferrioxamine mesylate (desferrioxamine) for managing excess iron levels in the blood of people with thalassaemia who depend on blood transfusions

Adults Acute Iron Intoxication IV or IM Maximum 6 g daily recommended by manufacturer. Its iron-complex ferrioxamine has different pharmacokinetic properties. American Academy of Pediatrics Committee on Nutrition.

Desferrioxamine in warm reperfusion media decreases liver injury aggravated by cold storage

If child remains asymptomatic for 6 to 8 hours after ingestion, further intervention is usually not required. As a result, the human has evolved to have a complex mechanism of regulating iron and limiting its availability.
