Epidural Anesthesia, Hypotension, and Changes in Intravascular Volume

It requires operating department practitioners as assistants to the anesthetist and other members of the OT team to support and help in the procedure. A practical approach to management of suspected epidural hematoma is displayed in Figure 2.

Post

In therapeutic doses, it produces little if any stimulation of either the spinal cord or cerebrum. The dural sac extends to the second sacral vertebra S2. Acknowledgements We would like to thank our patients and the operating room staff of Fatemeh hospital for their help.

Techniques for preventing a decrease in blood pressure during spinal anaesthesia for caesarean section

Last, ultrasound gel should be cleaned from the skin prior to performing neuraxial nerve block. Numerator data in NAP3 pertained to major complications over a 12-month period 2006—2007.

Epidural Anesthesia, Hypotension, and Changes in Intravascular Volume

Conclusions: Our results confirm that low-dose bupivacaine spinal anesthesia is associated with a lower risk of hypotension than previously believed, and it can therefore be safely used in severe preeclamptic women undergoing cesarean delivery. This chapter briefly reviews the anatomy, surface anatomy, and sonoanatomy of the spinal cord.

BLOOD PRESSURE CHANGES DURING SPINAL ANESTHESIA IN NONOPERATIVE CASES

Note that SSEPS are maintained during epidural blocks, although the amplitude is decreased and latency increased. However, because of the unpredictability of cerebral and other organ damage resulting from hypotension, most modern anesthesiologists employ controlled hypotension very sparingly, or not at all.

How Blood Pressure can be Affected by a Spinal Cord Injury

Only 6—8 of the 62 radicular vessels present during development persist into adult life.

[Cause of hypotension during spinal anesthesia]

Repair of the myelomeningocele is usually the first of numerous surgeries that the child will require. Spinal hematoma and spinal cord ischemia have a poorer prognosis than infective complications. They are either intramedullary or extramedullary, which, in turn, can be either intradural or epidural.
