Radiata Pine (Monterey Pine) — Spruced Christmas Trees

Our germplasm is produced through our breeding programme, past and present, and is characterised by breeding values. Maintaining pasturage beyond the first half of the rotation is often beset with problems of maintaining quantity and quality of pasture, and of maintaining good tree form with the grazing-induced increases in soil fertility particularly if stocking levels of P.

On drier sites, coast sagebrush, coyotebrush, and bush monkeyflower are present.

F.A.Q. PAGE

These plus-trees provided a foundation for the current breeding population which has advanced two to three generations. Extensively cultivated for timber in warm temperate zones, especially in New Zealand, it grows larger in cultivation than it does in the wild.

F.A.Q. PAGE

It is the mainstay of an industry predicted to make a significant contribution to the New Zealand economy by the year 2020. The best sites for growing good quality trees are lower fertility well-drained sites, without full exposure to wind. Genetics Population Differences The three mainland populations of Monterey pine, although disjunct, grow where climate and soil are similar.
