Am I making somewhere mistake and if not how should I precede, or is there some easier way of solving it? The idea of the equations is conditioning on the first step. Vālmīki The Online Books Page Online Books by Vālmīki A is available. Griffith, and Monier Monier-Williams, also contrib.

**Browse subject: Epic poetry, Sanskrit**

When you recurse to compute the expected time after the first step, you are only keeping track of the time taken after the first step. In words, the mean time to hit state 2 starting from state 1 is the sum of the mean time to hit state 2 starting from state  $i$ , times the probability to go directly to state  $i$  from state 1, plus one, to account for the first step itself.
