## Chalk diagenesis and its relation to petroleum exploration: oil from chalks, a modern miracle (Journal Article)

No simple definition suffices to embrace all Cretaceous chalks, which include sandy, marly, shelly, phosphatic, glauconitic, dolomitic, pyritic and organic-rich lithotypes.

## Upper Cretaceous

A section outlines the preservation of porosity which has allowed the Ekofisk and Tor Formations to retain an average porosity of 30 to 40% which would not have been possible under normal circumstances. Areas with thick overburden in which marine pore fluids have been retained.

## Waterflooding

The European Cretaceous chalk contains abundant chert beds and nodules. On the SE Nasser field the thickness of the Wahah Limestone ranges from zero to 107m within a distance of 2km. Open Access This article is distributed under the terms of the Creative Commons Attribution 4.

## Classification and characteristics of tight oil plays

Libya has 11 gas fields with recoverable reserves each of more than 1 TCF free and associated gas taken together Fig.

## Organic

Most secondary porosity resulted from dissolution of carbonate cements.

### **Upper Jurassic (Oxfordian) Smackover carbonate petroleum system characterization and modeling, Mississippi Interior Salt Basin area, northeastern Gulf of Mexico, USA**

The critical events include the initiation of the generation of crude oil, the commencement of hydrocarbon expulsion, the initiation of hydrocarbon migration, and the entrapment of hydrocarbons during the Early to Late Cretaceous. Areas with thicker overburden but considerable fracturing. The next well, named Sapakara West-1, will be spudded this week.

### **Chapter 8 Chalk Reservoirs**
