In this interpretation, parallel worlds are generated in a manner similar to and , with all states of the being realized in separate worlds. If the universe were sufficiently dense,  $k$  would equal  $+1$ , meaning that its average curvature throughout is positive and the universe will eventually recollapse in a , possibly starting a new universe in a.

## **The Universe of Sketches**

While the spatial size of the entire universe is unknown, the cosmic inflation equation indicates that it must have a minimum diameter of 23 trillion light years, and it is possible to measure the size of the , which is approximately 93 billion in diameter at the present day. These financial burdens may have contributed to Galileo's early desire to develop inventions that would bring him additional income. Many consider him to be the last of the great polymaths.
