Similarly, the so-called Pauling rules, which express the various relations between atoms that dictate the stable forms of a crystalline substance, were largely adumbrated by Bragg and others before Pauling published them. We also get glimpses of Pauling's acrimonious scientific rivalries, his occasional arrogance and tendency to self-promotion.

His curiosity for chemistry and science in general resulted in him winning not one but two Nobel Prizes, that are unshared. I hope our current young students are learning what they need to change the world as he did. Whether in clashes with William Bragg over X-ray crystallography, in his battles with medical orthodoxy over the efficacy of vitamin C therapy against cancer, or his crusades against nuclear testing and McCarthyism, Pauling manifested a quite unnerving certitude and Thacheresque disregard for even the remotest possibility that he might be wrong.
