Gold in the Black Hills of South Dakota

Spodumene, amblygonite, beryl and pollucite were all produced at the mine. Beryl peaked in 1953, when 392 short tons were produced from Black Hills mines Miller, 1959. Pegmatites are generally grouped within three major mining districts, which are the Keystone, Custer, and Hill City districts in the southern Hills, and the Tintic district in the northern Hills.

Bentonite Deposits of the Northern Black Hills District Wyoming, Montana, and South Dakota

The northern Black Hills district is an important source of commercial gel-forming sodium-type bentonite.

New York Mica mine circa 1923 USGS Photo Library. United States Department of Interior, Bureau of Mines, IC 6190. Early applications included the use of beryllium nitrate in the manufacture incandescent gas mantles to harden the mantle skeleton.

Black Hills and Badlands Geology

You are now on public land in the Black Hills National Forest. Lepidolite from the Ingersoll was used for the seventeen-foot lens in the observatory at Mount Wilson, California Clow, 2002.

Bentonite deposits of the northern Black Hills district, Wyoming, Montana, and South Dakota

Crystals up to 20 feet occur at the Beecher Lode. Homestake ore is virtually entirely contained in a unit of iron-formation locally known as the Homestake Formation, which seemingly had more gold in the original sediments than similar rocks exposed elsewhere in the Black Hills.

Rare Minerals from the Black Hills, SD

But here is an affordable, but nice, golden Baryte from Elk Creek with dozens of crystals to over 1cm all nicely terminated with just a few broken. Lawrence, Pennington, and Custer Counties have produced millions of ounces of gold.

Black Hills and Badlands Geology

Moore et al 1976 indicated the Big Chief was chosen as the type locality since the crystal structure analysis was done on this material. Geological Survey Open-File Reports QF series ; see index map. These area was once teeming with miners seeking their fortunes.
