Mission results from the first GEOSTAR observatory (Adriatic Sea, 1998)

The observatory was deployed at a distance of 25 km from the east coast of Sicily in southern Italy at a depth of 2105 m and was operated in a self-contained mode from October 2002 to February 2003 134 days. The forward-thinking provided here will assist in the development of new technologies and tools to address the major challenges associated with deep sea-mining: technologies for in situ and ex situ observation and data acquisition, biogeochemical processes, hazard assessment of deep-sea mining to marine organisms and development of modeling tools in support of risk assessment scenarios.

Science Technology Synergy for Research in the Marine Environment: Challenges for the XXI Century, Volume 12

[PDF] Acquisition And Processing Of Marine Seismic Data

Then we explain why the seafloor is an interesting observation point for geophysical parameters and how it differs from land sites.
