## Economic Fitness: the Economy as a Complex System

This patient passes the current DVLA criteria using the EVFT because the central defect is made up on only two missed points but fails the current DVLA criteria using the integrated visual field because the central defect is made up of six or more contiguous defects at the 10 dB level. This composite figure is made up in the same way as figures 3 and 4. Multiple copies available this title.

Our methodology was employed to collaborate with important private companies, spanning from oil companies like Royal Dutch Shell to consulting companies like the Boston Consulting Group, from investment funds like Azimut Milan to new Internet based firms like the LastMinute. The panel below the EVFT shows the monocular Humphrey grey scale for the same patient indicating the patient has bilateral visual field defects.
