HBase vs. Trafodion comparison		
	HBase	Trafodion + HBase
Data abstraction	Key and value pair	Relational schema
Physical Layout	Column family store where row data is stored together by cells	Same except there is a single column family with space-saving column encoding
Column values	Uninterpreted array of bytes	Explicitly defined and enforced data types
AOD Guarantee	Single row atomicity	Multi- SQL statements, tables, and rows defined as part of transaction
Language API	Get/put/delete	SQL (Trafodion invokes native HBase API)
Row Key Index	Single (string) row key	Composite (multi-column) row key
Secondary Indexes	Not supported	Arbitrary secondary key columns
