Diagnosis and Management of Acute Pericardial Syndromes

Aspirin is the first-choice drug in patients who have recently suffered a myocardial infarction, whereas indomethacin should be avoided in patients with acute ischemic heart disease, as it reduces coronary artery flow. Recurrent and Incessant Pericarditis -- 25.

The Pericardium

Stage II: Pericardiocentesis Pericardiocentesis should only be done when the patient presents with cardiac tamponade that is, for therapeutic reasons , or when purulent pericarditis is suspected. Download BD Chaurasia PDF Book for free below in ebook format. On the other hand, diagnosis of neoplastic pericarditis can be established in many patients with modern imaging techniques, cytological study of pericardial fluid, and conventional pericardial biopsy.

Likewise, tamponade is very uncommon in relapses. Clinical Manifestations The basic clinical symptom of acute pericarditis is chest pain.

The Pericardium: A Comprehensive Textbook

A CD containing respective videos on osteology and soft parts for better orientation of these topics and FAQs with answers and diagrams for proper preparation for the examinations accompanies each volume. The main concepts of any protocol for diagnostic management of acute pericarditis are: 1 knowledge of the epidemiological distribution of etiologies according to the geographic region; 2 importance of identifying some specific etiologies; and 3 knowledge of the diagnostic efficiency of invasive examinations of the pericardium pericardiocentesis and pericardial biopsy. The pericardial fluid is considered to be a plasma ultrafiltration product, like other serosal cavity fluids.

Echocardiography can also provide very useful information for establishing diagnosis of tamponade, essentially by detecting right atrial or ventricular collapse and abnormal mitral and tricuspid valve flow. Perspectives: The Pericardium in Health and Disease -- 2 .

Microphysiology of the Pericardium: Substrate for Intrapericardial Therapeutics, Herz

El presente trabajo está dedicado fundamentalmente al manejo diagnóstico y terapéutico de la pericarditis aguda. Should they be administered, however, the period of treatment should be at least 2 to 4 weeks. It should be emphasized that, even though it is fairly characteristic, the diagnosis of pericarditis cannot be established on the type of pain alone.
