MZ, there is a 50% chance of ZZ genotype for every newborn from these parents and this can be confirmed in the child by isoelectric focusing of serum. For most diseases, symptoms will vary from person to person. The most common deficiency alleles in North Europe are PI Z and PI S, and the majority of individuals with severe AATD are PI type ZZ.

Although this alternative pathway could also be at least partly sensitive to AAT inhibition, it may be less responsive than the direct effect on the neutrophil serine proteinase pathway. Individuals with AATD have one normal copy and one damaged copy, or they have two damaged copies.

Hereditary alpha

AATD occurs in approximately 1 in 2,500 individuals. For this reason, all patients with chronic obstructive pulmonary disease and patients with asthma and fixed obstruction should be tested to exclude the diagnosis of AATD.

About Alpha

For more information Krowka MJ, et al. These individuals should be counseled about the risk of transmission of the Z variant to future generations.
