## Palliative care in the management of lung cancer: analgesic utilization and barriers to optimal pain management

When is palliative care used in cancer care? Initially, they had to complete a survey exploring their knowledge on analgesics and potential fear of using opioids. Health care professionals in these fields tend to have less training in the skills necessary to deliver at least basic palliative care than those in oncology. Hospice care is the last part of an integrated palliative approach to care, and transition from integrated palliative care to hospice may involve a new set of care providers.

### Barriers to Access to Palliative Care

Participants pursued physical therapy 76 percent and other complementary modalities 24 percent for pain control.

#### [Opioid use and the management of cancer patient pain in palliative care clinic]

This rebranding needs to include administrators and politicians.

### Barriers to Access to Palliative Care

Students and residents infrequently have access to palliative care rotations, and the paucity of palliative care teaching in many medical school and residency programs makes it difficult for physicians to understand what happens in a specialist palliative care setting.

### Palliative Care in Cancer

Some suggestions have already been presented in discussing the barriers above, but I believe that lack of awareness of the role for modern palliative care is a key obstacle to patients receiving appropriate care. Objectives: Pain is one of the most important symptoms in palliative care, and has a major impact on the quality of life of cancer patients.

## **Palliative Care in Cancer**

Like the patient, they have changing needs. Besonders wichtig ist die Erkennung und Behandlung der Durchbruchschmerzen. Die Linderung der körperlichen Beschwerden durch Schmerz- und Symptomkontrolle ist ein wesentlicher Bestandteil eines palliativen Behandlungskonzepts.

### **[Pain therapy in palliative ENT patients]**

However, some study respondents did not use analgesics due to concerns of addiction, cost, or their healthcare providers not recommending analgesics. A palliative approach to care is particularly important when the prognosis of the patient is uncertain, and survivorship is a possibility.  
CONCLUSIONS Opiophobia seems to be common among palliative care patients up to 50% treated with strong opioids.
