Comparative biogeography of mammals on islands

Museum of Texas Tech University, N. This explanation is supported by several lines of evidence: 1 z values slopes of species-area curves are lower for non-volant mammals on oceanic islands than for those on landbridge islands, but are the opposite for bats; 2 z values for non-volant mammals are lower than those for bats on oceanic islands, but are higher than those for bats on landbridge islands; and 3 landbridge island faunas are attenuated mainland faunas, whereas those on oceanic islands are ecologically incomplete.
