## Study on the Direction of Land Reclamation and Ecological Reconstruction in Jiaozuo Coal Mining Area under the Angle of Central Plains Economic Zone

Some direct seeding and transplant methods are outlined. While each covers one particular subject area, inevitably some documents listed in one also are relevant to one of the other Bibliographies.

## Literature on the revegetation of coal

Results showed that the reclaimed mined land had 16 understory species from 6 families, and the abandoned mined land had 10 species from 3 families, lower than that of natural forests, which were 92 and 112. The latter method increases the load carrying capacity of soils and can be achieved by using reinforced earth or a chemical treatment.

## Land reclamation and strip

The availability of undisturbed habitat adjacent to small sized, seeded areas, has made it possible for wildlife to take advantage of the reclaimed sites and still have sufficient amount of natural food and cover available with which to meet the nutritional and habitat needs of the animal. Another federal court ruling in 1999 said that valley fills also violated the Clean Water Act.

## Reclamation of coal

There is an appendix entitled 'Environmental Effects of Mining in Minnesota'. This is generally the most inexpensive means of reclamation.
