

Common disorders and diseases of childhood.

Oxford University Press - 7 Common Contagious Diseases in Childhood

Specific Eye Problems in Children		
Condition	Description	Treatment
Conjunctivitis	An irregular shaped cornea that can become very red and watery.	Glasses if it causes blurred vision.
Blocked tear ducts	In some babies, the eyes overflow because they have difficulty getting rid of tears. This may need a simple procedure or surgery may be necessary.	Gentle massage of the tear duct can help reduce eye overflow. If this does not work, further treatment or surgery may be necessary.
Cataract	A clouding of the lens of the eye.	Most cataracts in children are congenital (present at birth). Some are caused by an infection during pregnancy. Others are caused by an injury. In babies and children are rare and usually not related to an infection or injury.
Chalazion	A fatty, painless lump on the eyelid due to blocked glands.	Most resolve on their own or are treated with eye drops. If they do not resolve, they may need to be removed surgically.
Droopy eyelids (ptosis)	When the eyelids are not open as they should be. This is caused by weakness in the muscle that lifts the eyelid.	Most cases of ptosis in children are congenital (present from birth). Some are caused by an infection during pregnancy. Others are caused by an injury. In babies and children are rare and usually not related to an infection or injury.
Falsely misaligned eyes (esotropia)	Caused by a wider nasal bridge or weak eye muscles. When this happens, the eyes only appear to cross part of the time. It is important to treat this condition early, as it can affect a child's learning ability.	Most cases of esotropia in children are congenital (present from birth). Some are caused by an infection during pregnancy. Others are caused by an injury. In babies and children are rare and usually not related to an infection or injury.
Exophthalmos (proptosis)	Bulging of the eye. The degree of bulging depends on how much the eye is protruding.	If it becomes severe or causes the eye its visual field is reduced, glasses are needed.
Glaucoma	A condition in which the pressure inside the eye is too high. This can damage the optic nerve.	Glasses in children are usually needed surgery.
Lazy eye (amblyopia)	Reduced vision from lack of use in one eye. This can be caused by strabismus or eye muscle problems.	Wearing a patch over the good eye helps to improve the lazy eye. Other treatments commonly include glasses or contact lenses, eye drops or eye patches. Surgery may be needed to correct eye muscle problems.
Misaligned eyes (strabismus)	When one eye turns inward, outward, up or down. It is caused by eye muscle problems that do not work well together.	Difficulty seeing clearly often causes children to turn their head to one side but this can also cause eye strain in children aged 5-10 years.
Near视物困难 (myopia)	Difficulty seeing things far away. This is usually due to refraction, where light rays do not focus correctly on the retina.	Glasses are used to correct blurred distance vision. Contact lenses are available for people who prefer not to wear glasses. Some children with myopia may need to wear glasses and contact lenses may be used when playing sports.
Watery eyes (epiphora)	A watery discharge from the front surface of the eye. This is usually caused by an infection or irritation of the eye.	Artificial drops or ointments to prevent heating and drying out the eye. Warm compresses and antibiotic drops or ointments.
Myo (Hordeolum)	A painful, red bump on the eyelid due to an infection of the oil glands of the eyelid. This usually results in a smaller eyelid.	Warm compresses and washing the eyelid with baby shampoo. Antibiotic may be needed if there is an infection.
Swelling eyelids (steatophytic)	Swelling of the eyelids. This is usually caused by an infection of the oil glands of the eyelid. This usually results in a smaller eyelid.	Warm compresses and washing the eyelid with baby shampoo. Antibiotic may be needed if there is an infection.

10 Common Childhood Illnesses and Their Treatments

Treatment consists of keeping the affected areas clean and local or systemic administration of antibiotics.

Childhood disease and disorder

There are various treatments for restoring teeth, but parents should remind their children to prevent their teeth from dental caries. Later, he may recommend various tests based on the affected organs: Antinuclear antibody tests: Antinuclear antibody ANA test is the primary test done to diagnose autoimmune disorders. The platelets help to stop bleeding in two ways: they contain a clotting factor, and they serve to block rents in blood-vessel walls.

Pictures of childhood rashes and skin condition

In fact, indicates that they affect 75-percent of people over the age of 45.

7 Common Contagious Diseases in Childhood

Dementia Semantic Frontotemporal dementia FTD describes a clinical syndrome associated with shrinking of the frontal and temporal anterior lobes of the brain. Typically shows up in the first year of life and often is gone by age 2, but can persist through adulthood.

Childhood disease and disorder

Children begin to lose the ability to walk, play, and speak as the disease progresses, with a rapid advancement of symptoms seen between the ages of 9 and 11. In normal development, neuron proliferation - the process in which nerve cells divide to form new generations of cells - is regulated so that the correct number of cells is produced in the proper place at the appropriate time.

Overview of Bone Disorders in Children

It is not a substitute for professional medical advice, diagnosis or treatment. Most children need surgery to remove a cataract and see clearly again.

Childhood illnesses

Tremor may begin in one extremity and later spread to involve the entire voluntary muscular system.
