The magnitude of the increase in blood volume varies according to the size of the woman, the number of prior pregnancies, and the number of fetuses she is carrying.

Although no formal statistical comparison was undertaken, the results of these studies illustrate the distribution that can be found around the world.

### Quantitative Standards for Fetal and Neonatal Autopsy

Measurement results were stored electronically, with the images together with all information collected from the mother and the perinatal outcomes. Such an adjustment may represent an over-correction of the results reducing biological variation in size and growth.

### Fetal Autopsy Resources

Extensive and reliable web sources allow for further study or checking for updated information.

### FNPS — Department of Physiology, Development and Neuroscience

Blood volume expansion begins early in the first trimester, increases rapidly in the second trimester, and plateaus at about the 30th week. The magnitude of the differences among countries can also be appreciated in , where selected country percentiles are shown with the corresponding global percentile curve.
